

Project Summary

My Website “Get To Know Me”

This website aims to get to know me a little more. Get to understand some of my hobbies, TV shows, movies, and soccer teams, and I may be adding sections on music and other hobbies of mine. To navigate the website, you have the three buttons up top marked “Movies”, “TV”, and “Soccer”. Each of these buttons will take you to their respective area on the single-page website. What will be added in the future is finishing the bookmark tab as it is a coming soon page right now. I plan on adding a function so you can save/add your favorite movies, TV shows, and soccer teams to the bookmark tab and save for later. The main purpose is a store of my favorite movies, TV shows, and soccer teams so that in the future I can look back at what I was watching. For the user, they can use this website to understand me, but also save their favorite movies and create a list of their favorites. My site works so that the user has three tabs to navigate to the different sections of the page. The fourth button is for the coming soon tab which will be implemented later, along with the embedded trailers. You also have my contact info if the user wants to reach out or get in touch along with a brief description of the project and why I made it. Along with this, the movie section allows users to add movies of their choice, asking for the title, director, image, URL and trailer URL. With this, the user will be able to store their favorite movies. If they don't like their movie then they have the option to remove the movie from the list and it will save locally. If they leave the website, not to worry, their movie list will be saved locally. If you ever want to reset your movie list, then you can also do that with the red button next to “add your movie” and it will reset the local storage and return the website back to normal. Along with this, every section has a trailer button which will open up a popup with their respective trailers. This functionality will be coming soon, but every section has its own trailers embedded in that just need to have the final touches on them. Finally, the footer represents that the website belongs to me and if you want to contact me, there is a button that will direct the user to my main email address. Lastly, the extras that I used are Event-driven DOM Manipulation: Users need to be able to add and delete DOM nodes and DOM Storage (Local or Session Storage) which I explained their use earlier in this document. Overall I really enjoyed working on this project and I hope to improve upon it and use it as a store of my favorite movies over

time. Hope you enjoy it! Also, I had to add all of the images in a separate file due to the limit on stackblitz being 1mb for all images in a folder. So they are in the project folder under img, but some of the images on stackblitz are image links to their respective URL.
